

SIH26034 — Forensic Report, Evidence & QA Specification v2

FINAL REFERENCE PACK v2 — audited against the current SIH26034 blueprint/build prompts and current official-source requirements.

Legal posture

The report supports evidence integrity and traceability. Do not claim it is automatically court-admissible; admissibility depends on applicable evidentiary requirements and process.

Report

Three parts: inspection/determination summary; rule findings with calculations, inputs, thresholds/tolerances, provenance and corrections; evidence register/integrity block. Include remarks/signature area and provisional/draft notice where applicable.

Verification

Report number + QR to an unauthenticated read-only view showing report number, case ID, issue time, officer identifier, determination, canonical inspection hash and stored file hash. No evidence images, premises details or personal data.

Integrity

Hash original evidence before processing; keep canonical inspection hash and downloaded report file hash separate. Never claim a PDF can contain the hash of its own final bytes before those bytes exist.

Audit chain

Hash-chain audit entries and provide `verify_chain()` plus a test that breaks one entry and detects the break.

QA

Golden fixtures: clean/compliant, inconsistent unit price, overlaid price label, plus a manual-review case. E2E: login → create → upload → calibrate → analyze → correct → re-analyze → finalise → report → verify.

Failure handling

Missing calibration → manual review; low OCR confidence → edit/review; poor image → quality warning/block on silent trust; conflicting views → review; model unavailable → fallback/manual; report failure → preserve case and retry.

Acceptance

All P0 checks pass together; PDF contains required sections/QR/hash; verification matches stored/downloaded hashes; broken audit row is detected; avoid misleading product copy such as 'admissible', 'tamper-proof' or 'AI detects'.
